## Lecture 4

 Single View Metrology

## Professor Silvio Savarese

Computational Vision and Geometry Lab

## Lecture 4

## Single View Metrology

- Review calibration
- Vanishing points and lines
- Estimating geometry from a single image
- Extensions

Reading:<br>[HZ] Chapter 2 "Projective Geometry and Transformation in 3D"<br>[HZ] Chapter 3 "Projective Geometry and Transformation in 3D"<br>[HZ] Chapter 8 "More Single View Geometry"<br>[Hoeim \& Savarese] Chapter 2

## Calibration Problem

## Calibration Problem

## Once the camera is calibrated...

$$
\mathrm{M}=\mathrm{K}\left[\begin{array}{ll}
\mathrm{R} & \mathrm{~T}
\end{array}\right]
$$

-Internal parameters K are known

- $\mathrm{R}, \mathrm{T}$ are known - but these can only relate C to the calibration rig

Can I estimate $P$ from the measurement $p$ from a single image?
No - in general $*[P$ can be anywhere along the line defined by $C$ and $p]$

## Recovering structure from a single view

## Recovering structure from a single view

http://www.robots.ox.ac.uk/~vgg/projects/SingleView/models/hut/hutme.wrl

## Transformation in 2D

## -Isometries

## -Similarities

-Affinity
-Projective

## Transformation in 2D

Isometries:
[Euclideans]

$$
\left[\begin{array}{c}
x^{\prime} \\
y^{\prime} \\
1
\end{array}\right]=\left[\begin{array}{cc}
R & t \\
0 & 1
\end{array}\right]\left[\begin{array}{c}
x \\
y \\
1
\end{array}\right]=H_{e}\left[\begin{array}{c}
x \\
y \\
1
\end{array}\right]
$$

- Preserve distance (areas)
- 3 DOF
- Regulate motion of rigid object

## Transformation in 2D

Similarities: $\quad\left[\begin{array}{l}x^{\prime} \\ y^{\prime} \\ 1\end{array}\right]=\left[\begin{array}{cc}s R & t \\ 0 & 1\end{array}\right]\left[\begin{array}{l}x \\ y \\ 1\end{array}\right]=H_{s}\left[\begin{array}{l}x \\ y \\ 1\end{array}\right]$

- Preserve
- ratio of lengths
- angles
-4 DOF

## Transformation in 2D

Affinities: $\quad\left[\begin{array}{l}x^{\prime} \\ y^{\prime} \\ 1\end{array}\right]=\left[\begin{array}{cc}A & t \\ 0 & 1\end{array}\right]\left[\begin{array}{l}x \\ y \\ 1\end{array}\right]=H_{a}\left[\begin{array}{c}x \\ y \\ 1\end{array}\right]$

$$
\mathrm{A}=\left[\begin{array}{ll}
\mathrm{a}_{11} & \mathrm{a}_{12} \\
\mathrm{a}_{21} & \mathrm{a}_{22}
\end{array}\right]=\mathrm{R}(\boldsymbol{\theta}) \cdot \mathrm{R}(-\boldsymbol{\phi}) \cdot \mathrm{D} \cdot \mathrm{R}(\boldsymbol{\phi}) \quad \mathrm{D}=\left[\begin{array}{cc}
\mathrm{s}_{\mathrm{x}} & 0 \\
0 & \mathrm{~s}_{\mathrm{y}}
\end{array}\right]
$$

## Transformation in 2D

Affinities: $\left[\begin{array}{c}x^{\prime} \\ y^{\prime} \\ 1\end{array}\right]=\left[\begin{array}{cc}A & t \\ 0 & 1\end{array}\right]\left[\begin{array}{c}x \\ y \\ 1\end{array}\right]=H_{a}\left[\begin{array}{c}x \\ y \\ 1\end{array}\right]$

$$
\mathrm{A}=\left[\begin{array}{ll}
\mathrm{a}_{11} & \mathrm{a}_{12} \\
\mathrm{a}_{21} & \mathrm{a}_{22}
\end{array}\right]=\mathrm{R}(\boldsymbol{\theta}) \cdot \mathrm{R}(-\boldsymbol{\phi}) \cdot \mathrm{D} \cdot \mathrm{R}(\boldsymbol{\phi}) \quad \mathrm{D}=\left[\begin{array}{cc}
\mathrm{s}_{\mathrm{x}} & 0 \\
0 & \mathrm{~s}_{\mathrm{y}}
\end{array}\right]
$$

-Preserve:

- Parallel lines
- Ratio of areas
- Ratio of lengths on collinear lines
- others...
-6 DOF

## Transformation in 2D

Projective: $\left[\begin{array}{c}x^{\prime} \\ y^{\prime} \\ 1\end{array}\right]=\left[\begin{array}{cc}A & t \\ v & b\end{array}\right]\left[\begin{array}{l}x \\ y \\ 1\end{array}\right]=H_{p}\left[\begin{array}{c}x \\ y \\ 1\end{array}\right]$

- 8 DOF
- Preserve:
- cross ratio of 4 collinear points
- collinearity
- and a few others...

## The cross ratio

The cross-ratio of 4 collinear points

$$
\frac{\left\|\mathbf{P}_{3}-\mathbf{P}_{1}\right\|\left\|\mathbf{P}_{4}-\mathbf{P}_{2}\right\|}{\left\|\mathbf{P}_{3}-\mathbf{P}_{2}\right\|\left\|\mathbf{P}_{4}-\mathbf{P}_{1}\right\|} \quad \quad \mathbf{P}_{i}=\left[\begin{array}{c}
X_{i} \\
Y_{i} \\
Z_{i} \\
1
\end{array}\right]
$$

Can permute the point ordering $\frac{\left\|\mathbf{P}_{1}-\mathbf{P}_{3}\right\|\left\|\mathbf{P}_{4}-\mathbf{P}_{2}\right\|}{\left\|\mathbf{P}_{1}-\mathbf{P}_{2}\right\|\left\|\mathbf{P}_{4}-\mathbf{P}_{3}\right\|}$

## Lines in a 2D plane

$$
\begin{aligned}
& \mathrm{ax}+\mathrm{by}+\mathrm{c}=0 \\
& \mathrm{l}=\left[\begin{array}{c}
\mathrm{a} \\
\mathrm{~b} \\
\mathrm{c}
\end{array}\right] \\
& \text { If } \mathrm{x}=\left[\mathrm{x}_{1}, \mathrm{x}_{2}\right]^{\top} \in \mathrm{I} \quad\left[\begin{array}{c}
\mathrm{x}_{1} \\
\mathrm{x}_{2} \\
1
\end{array}\right]^{\mathrm{T}}\left[\begin{array}{l}
\mathrm{a} \\
\mathrm{~b} \\
\mathrm{c}
\end{array}\right]=0
\end{aligned}
$$

## Lines in a 2D plane

Intersecting lines

$$
\mathrm{x}=1 \times \mathrm{l}^{\prime}
$$

Proof

$$
\begin{array}{lll}
1 \times l^{\prime} \perp 1 & \rightarrow\left(l \times l^{\prime}\right) \cdot 1=0 & \rightarrow x \in l \\
1 \times l^{\prime} \perp l^{\prime} & \rightarrow \underbrace{\left(l \times l^{\prime}\right.}_{\mathrm{x}}) \cdot l^{\prime}=0 & \rightarrow x \in l^{\prime}
\end{array}
$$

$\rightarrow \mathrm{x}$ is the intersecting point

## 2D Points at infinity (ideal points)

$$
\begin{gathered}
\mathrm{x}=\left[\begin{array}{l}
\mathrm{x}_{1} \\
\mathrm{x}_{2} \\
\mathrm{x}_{3}
\end{array}\right], \mathrm{x}_{3} \neq 0 \\
x_{\infty}=\left[\begin{array}{c}
x_{1}^{\prime} \\
x_{2}^{\prime} \\
0
\end{array}\right]
\end{gathered}
$$

$$
\begin{gathered}
1=\left[\begin{array}{l}
\mathrm{a} \\
\mathrm{~b} \\
\mathrm{c}
\end{array}\right] \\
l^{\prime}=\left[\begin{array}{l}
a^{\prime} \\
b^{\prime} \\
c^{\prime}
\end{array}\right]
\end{gathered}
$$

Let's intersect two parallel lines:

$$
\rightarrow l \times l^{\prime} \propto\left[\begin{array}{c}
b \\
-a \\
0
\end{array}\right]=x_{\infty}
$$

- In Euclidian coordinates this point is at infinity
- Agree with the general idea of two lines intersecting at infinity

## 2D Points at infinity (ideal points)

Note: the line $\mathrm{I}=[\mathrm{ab} \mathrm{c}]^{\top}$ pass trough the ideal point $X_{\infty}$

$$
\begin{gathered}
l=\left[\begin{array}{l}
\mathrm{a} \\
\mathrm{~b} \\
\mathrm{c}
\end{array}\right] \\
l^{\prime}=\left[\begin{array}{l}
a^{\prime} \\
b^{\prime} \\
c^{\prime}
\end{array}\right]
\end{gathered}
$$

$$
1^{\mathrm{T}} x_{\infty}=\left[\begin{array}{lll}
a & b & c
\end{array}\right]\left[\begin{array}{c}
b \\
-a \\
0
\end{array}\right]=0
$$

So does the line l' since a b' = a' b

## Lines infinity $1_{\infty}$

Set of ideal points lies on a line called the line at infinity How does it look like?

$$
1_{\infty}=\left[\begin{array}{l}
0 \\
0 \\
1
\end{array}\right]
$$

Indeed: $\left[\begin{array}{c}x_{1} \\ x_{2} \\ 0\end{array}\right]^{T}\left[\begin{array}{l}0 \\ 0 \\ 1\end{array}\right]=0$

A line at infinity can thought of the set of "directions" of lines in the plane

## Projective transformation of a point at infinity

$$
\begin{aligned}
& H=\left[\begin{array}{ll}
A & t \\
v & b
\end{array}\right] \\
& p^{\prime}=H p \\
& \text { is it a point at infinity? } \\
& \boldsymbol{H} p_{\infty}=?=\left[\begin{array}{ll}
A & t \\
v & b
\end{array}\right]\left[\begin{array}{l}
1 \\
1 \\
0
\end{array}\right]=\left[\begin{array}{l}
p_{x}^{\prime} \\
p_{y}^{\prime} \\
p_{z}^{\prime}
\end{array}\right] \\
& \text {...no! } \\
& H_{A} \quad p_{\infty}=?=\left[\begin{array}{cc}
A & t \\
0 & b
\end{array}\right]\left[\begin{array}{l}
1 \\
1 \\
0
\end{array}\right]=\left[\begin{array}{c}
p_{x}^{\prime} \\
p^{\prime}{ }_{y} \\
0
\end{array}\right] \\
& \text { An affine } \\
& \text { transformation } \\
& \text { of a point } \\
& \text { at infinity is } \\
& \text { still a point at } \\
& \text { infinity }
\end{aligned}
$$

Projective transformation of a line (in 2D)

$$
\begin{gather*}
\mathrm{H}=\left[\begin{array}{ll}
\mathrm{A} & \mathrm{t} \\
\mathrm{v} & \mathrm{~b}
\end{array}\right] \\
\mathrm{l}^{\prime}=\mathrm{H}^{-\mathrm{T}} \mathrm{l} \\
\mathrm{H}^{-\mathrm{T}} \mathbf{1}_{\infty}=?=\left[\begin{array}{cc}
\mathrm{A} & \mathrm{t} \\
\mathrm{v} & \mathrm{~b}
\end{array}\right]^{-\mathrm{T}}\left[\begin{array}{l}
0 \\
0 \\
1
\end{array}\right]=\left[\begin{array}{c}
\mathrm{t}_{\mathrm{x}} \\
\mathrm{t}_{\mathrm{y}} \\
\mathrm{~b}
\end{array}\right] \ldots \text { no! } \\
\mathrm{H}_{\mathrm{A}}^{-\mathrm{T}} 1_{\infty}=? \quad=\left[\begin{array}{ll}
A & t \\
0 & 1
\end{array}\right]^{-T}\left[\begin{array}{l}
0 \\
0 \\
1
\end{array}\right]=\left[\begin{array}{cc}
A^{-T} & 0 \\
-t^{T} A^{-T} & 1
\end{array}\right]\left[\begin{array}{l}
0 \\
0 \\
1
\end{array}\right]=\left[\begin{array}{l}
0 \\
0 \\
1
\end{array}\right]
\end{gather*}
$$

## Points and planes in 3D

$$
\mathrm{x}=\left[\begin{array}{c}
\mathrm{x}_{1} \\
\mathrm{x}_{2} \\
\mathrm{x}_{3} \\
1
\end{array}\right]
$$

$\mathrm{x} \in \Pi \leftrightarrow \mathrm{x}^{\mathrm{T}} \Pi=0$
$a x+b y+c z+d=0$

How about lines in 3D?

- Lines have 4 degrees of freedom - hard to represent in 3D-space
- Can be defined as intersection of 2 planes

## Vanishing points

In 3D, vanishing points are the equivalent of ideal points in 2D Points where parallel lines intersect in 3D

## Vanishing points

In 3D, vanishing points are the equivalent of ideal points in 2D
Points where parallel lines intersect in 3D

## The horizon line

## The horizon line

## Planes at infinity \& vanishing lines

- Parallel planes intersect the plane at infinity in a common line - the vanishing line ( $\rightarrow$ horizon)
- A set of vanishing lines defines the plane at infinity $\Pi_{\infty}$
- 2 planes are parallel iff their intersections is a line that belongs to $\Pi_{\infty}$

## Vanishing points and their image

$$
\begin{gathered}
\mathbf{V}=\mathbf{K} \mathbf{d} \\
\mathbf{x}_{\infty}=\left[\begin{array}{l}
\mathbf{d} \\
a \\
b \\
c \\
0
\end{array}\right] \xrightarrow{\mathbf{M}} \mathbf{v}=\mathbf{X}_{\infty} \mathbf{M}=\mathbf{K}\left[\begin{array}{ll}
\mathbf{I} & \mathbf{0}
\end{array}\right]\left[\begin{array}{c}
a \\
b \\
c \\
0
\end{array}\right]=\mathbf{K}\left[\begin{array}{l}
a \\
b \\
c
\end{array}\right]
\end{gathered}
$$

## Vanishing points - example

v1, v2: measurements $\mathrm{K}=$ known and constant

Can I compute R? No rotation around $z$

$$
\begin{aligned}
& \mathbf{d}_{1}=\frac{\mathrm{K}^{-1} \mathbf{v}_{1}}{\left\|\mathrm{~K}^{-1} \mathbf{v}_{1}\right\|} \\
& \mathbf{d}_{2}=\frac{\mathrm{K}^{-1} \mathbf{v}_{2}}{\left\|\mathrm{~K}^{-1} \mathbf{v}_{2}\right\|}
\end{aligned}
$$

$\mathrm{R} \mathbf{d}_{1}=\mathbf{d}_{2} \longrightarrow \mathrm{R}$

## Vanishing lines and their images

Parallel planes intersect the plane at infinity in a common line - the vanishing line (horizon)

$$
\mathbf{n}=\mathrm{K}^{\mathrm{T}} \mathbf{l}_{\text {horiz }}
$$

## Lecture 4

## Single View Metrology

- Review calibration
- Vanishing points and line
- Estimating geometry from a single image
- Extensions

## Reading:

[HZ] Chapter 2 "Projective Geometry and Transformation in 3D"
[HZ] Chapter 3 "Projective Geometry and Transformation in 3D"
[HZ] Chapter 8 "More Single View Geometry"
[Hoeim \& Savarese] Chapter 2

# Estimating geometry \& calibrating the camera from a single image 

## Are these two lines parallel or not?

- Recognize the horizon line
- Measure if the 2 lines meet at the horizon
- if yes, these 2 lines are // in 3D
-Recognition helps reconstruction! -Humans have learnt this

## Angle between 2 vanishing points

$$
\cos \boldsymbol{\theta}=\frac{\mathrm{v}_{1}^{\mathrm{T}} \omega \mathrm{v}_{2}}{\sqrt{\mathrm{v}_{1}^{\mathrm{T}} \omega \mathrm{v}_{1}} \sqrt{\mathrm{v}_{2}^{\mathrm{T}} \omega \mathrm{v}_{2}}} \quad \omega=\left(K K^{T}\right)^{-1}
$$

$$
\text { If } \boldsymbol{\theta}=90 \rightarrow \mathrm{~V}_{1}^{\mathrm{T}} \boldsymbol{\omega} \mathrm{~V}_{2}=0
$$

## Projective transformation of $\Omega_{\infty}$

Absolute conic

$$
\boldsymbol{\omega}=P^{-T} \Omega_{\infty} P^{-1}=\left(K K^{T}\right)^{-1}
$$

$$
P=K\left[\begin{array}{ll}
R & T]
\end{array}\right.
$$

1. It is not function of $R, T$
2. $\omega=\left[\begin{array}{lll}\omega_{1} & \omega_{2} & \omega_{4} \\ \omega_{2} & \omega_{3} & \omega_{5} \\ \omega_{4} & \omega_{5} & \omega_{6}\end{array}\right]$
symmetric
3. $\omega_{2}=0$ zero-skew

$$
\omega_{2}=0
$$

$$
\text { 4. } \quad \omega_{1}=\omega_{3}
$$

## Angle between 2 scene lines

## Single view calibration - example

$$
\begin{cases}\mathrm{v}_{1}^{\mathrm{T}} \boldsymbol{\omega} \mathrm{v}_{2}=0 & \boldsymbol{\omega}_{2}=0 \\ \mathrm{v}_{1}^{\mathrm{T}} \boldsymbol{\omega} \mathrm{v}_{3}=0 & \boldsymbol{\omega}_{1}=\boldsymbol{\omega}_{3}\end{cases}
$$

$$
\rightarrow \text { Compute } \omega:
$$

Once $\omega$ is calculated, we get K :
$\omega=\binom{K}{K^{T}}^{-1} \longrightarrow \mathrm{~K}$
(Cholesky factorization; HZ pag 582)

## Single view reconstruction - example

K known $\rightarrow \quad \mathbf{n}=\mathrm{K}^{\mathrm{T}} \mathbf{l}_{\text {horiz }} \quad \begin{aligned} & \text { = Scene plane orientation in } \\ & \text { the camera reference system }\end{aligned}$

Select orientation discontinuities

## Single view reconstruction - example

Recover the structure within the camera reference system
Notice: the actual scale of the scene is NOT recovered
-Recognition helps reconstruction! -Humans have learnt this

Are these two lines parallel or not?

- Recognize the horizon line
- Measure if the 2 lines meet at the horizon
- if yes, these 2 lines are // in 3D

## Lecture 4

## Single View Metrology

- Review calibration
- Vanishing points and lines
- Estimating geometry from a single image
- Extensions
