Administrative

Project proposal due Monday Apr 18, 11:59pm

This week's discussion section is moved to Wed 3-4pm.

Will discuss how to design a project and guidelines.

Fei-Fei Li, Jiajun Wu, Ruohan Gao

Lecture 5 - 3

Administrative

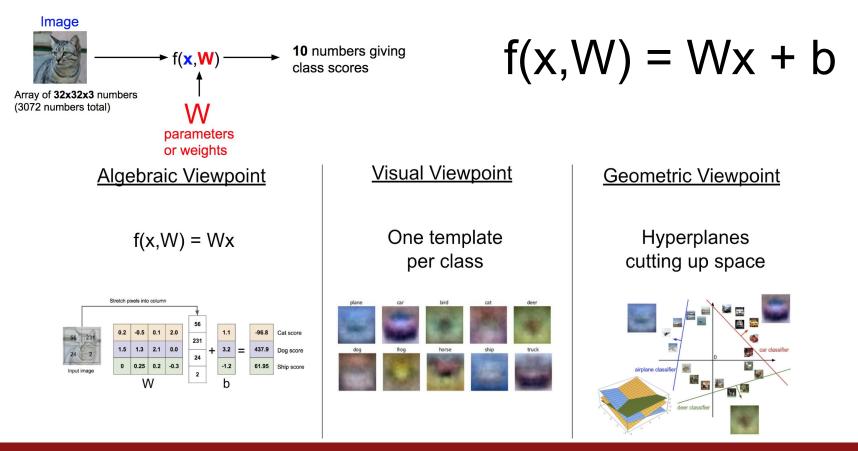

AWS Credit

- Ed announcement soon
- A Google Doc tutorial will be shared on how to use AWS
- Fill out the Google Form with your AWS account ID if you want AWS cloud credit for your project

Lecture 5 - 4

<u>April 12, 2022</u>

Recap: Image Classification with Linear Classifier

Fei-Fei Li, Jiajun Wu, Ruohan Gao

Lecture 5 - 5

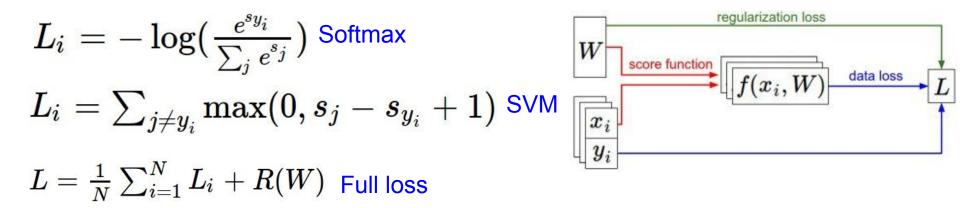

Recap: Loss Function

- We have some dataset of (x,y) -
- We have a **score function**:
- We have a **loss function**:

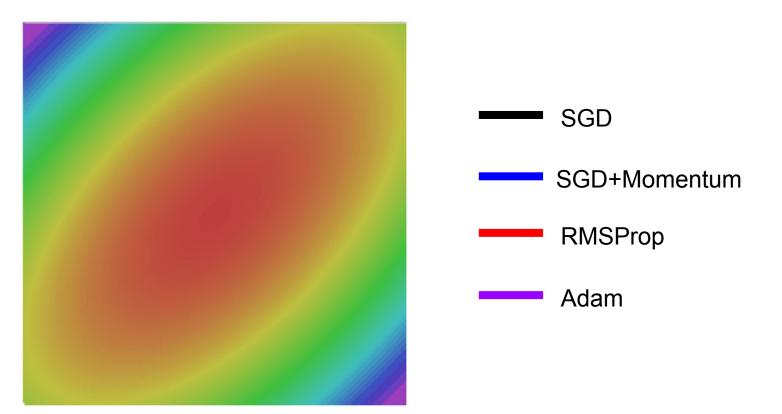

$$s=f(x;W)=Wx$$

Lecture 5 - 6

April 12, 2022

Recap: Optimization

Fei-Fei Li, Jiajun Wu, Ruohan Gao

Lecture 5 - 7 April 12, 2022

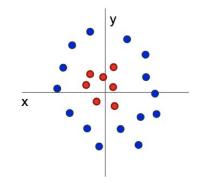

Problem: Linear Classifiers are not very powerful

Visual Viewpoint

Linear classifiers learn one template per class

Geometric Viewpoint

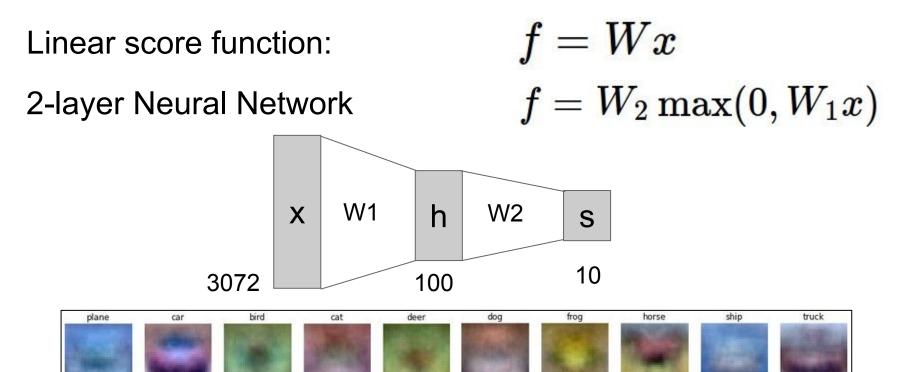

Linear classifiers can only draw linear decision boundaries

April 12, 2022

Lecture 5 - 16 April 12, 2022

Image features

Example: Color Histogram

Fei-Fei Li, Jiajun Wu, Ruohan Gao

Lecture 5 - 18 April 12, 2022

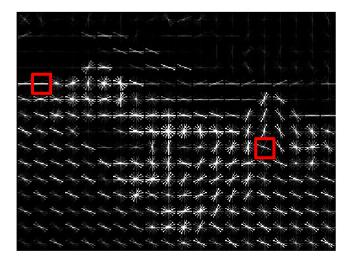

Example: Histogram of Oriented Gradients (HoG)

Divide image into 8x8 pixel regions Within each region quantize edge direction into 9 bins

Lowe, "Object recognition from local scale-invariant features", ICCV 1999 Dalal and Triggs, "Histograms of oriented gradients for human detection," CVPR 2005

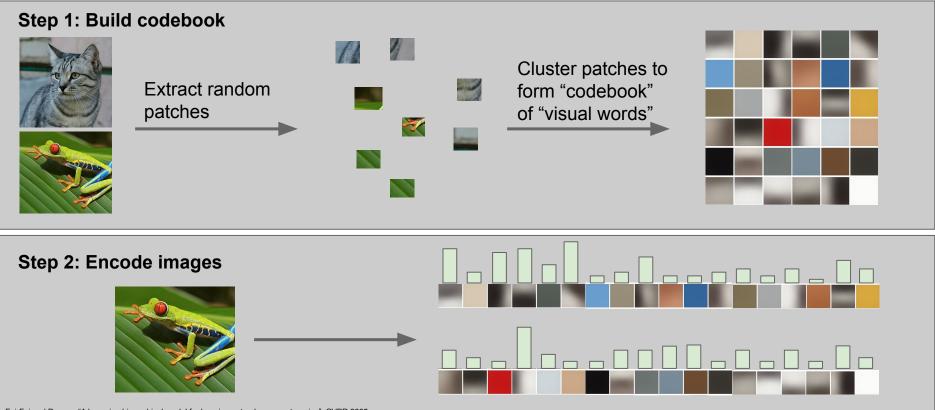

Fei-Fei Li, Jiajun Wu, Ruohan Gao

Example: 320x240 image gets divided into 40x30 bins; in each bin there are 9 numbers so feature vector has 30*40*9 = 10,800 numbers

Lecture 5 - 19

Example: Bag of Words

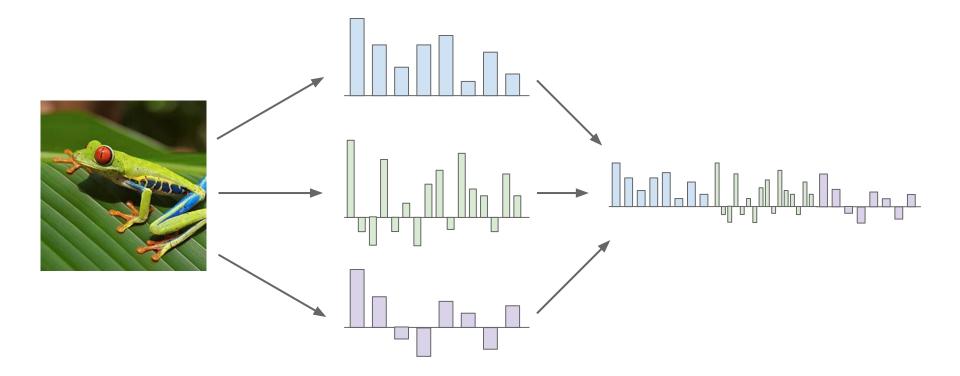

Fei-Fei and Perona, "A bayesian hierarchical model for learning natural scene categories", CVPR 2005

In practice: Common to zero pad the border

e.g. input 7x7 **3x3** filter, applied with stride 1
pad with 1 pixel border => what is the output?

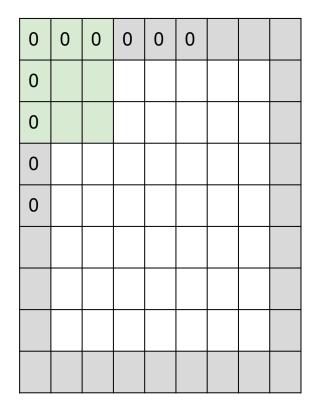

Lecture 5 - 84

7x7 output!

(recall:) (N + 2P - F) / stride + 1

<u>April 12, 2022</u>

In practice: Common to zero pad the border

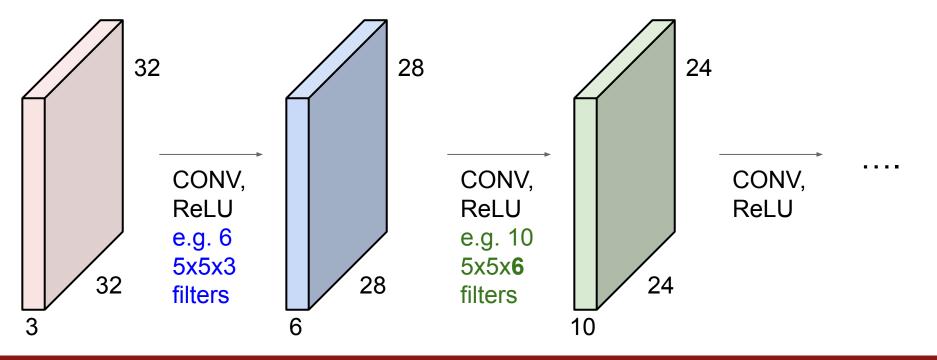

e.g. input 7x7
3x3 filter, applied with stride 1
pad with 1 pixel border => what is the output?

7x7 output!

in general, common to see CONV layers with
stride 1, filters of size FxF, and zero-padding with
(F-1)/2. (will preserve size spatially)
e.g. F = 3 => zero pad with 1
F = 5 => zero pad with 2
F = 7 => zero pad with 3

Remember back to...

E.g. 32x32 input convolved repeatedly with 5x5 filters shrinks volumes spatially! (32 -> 28 -> 24 ...). Shrinking too fast is not good, doesn't work well.

Lecture 5 - 96

Convolution layer: summary

Let's assume input is $W_1 \times H_1 \times C$ Conv layer needs 4 hyperparameters:

- Number of filters K
- The filter size **F**
- The stride S
- The zero padding P

This will produce an output of $W_2 \times H_2 \times K$ where:

- $W_2 = (W_1 F + 2P)/S + 1$
- $H_2 = (H_1 F + 2P)/S + 1$

Number of parameters: F²CK and K biases

Fei-Fei Li, Jiajun Wu, Ruohan Gao

Lecture 5 - 97

April 12, 2022

Convolution layer: summary Common settings:

Let's assume input is $W_1 \times H_1 \times C$ Conv layer needs 4 hyperparameters: F = 3, S = 1, P = 1

- Number of filters **K**
- The filter size **F**
- The stride **S**
- The zero padding P

This will produce an output of $W_2 \times H_2 \times K$ where:

-
$$W_2 = (W_1 - F + 2P)/S + 1$$

- $H_2^- = (H_1^- - F + 2P)/S + 1$

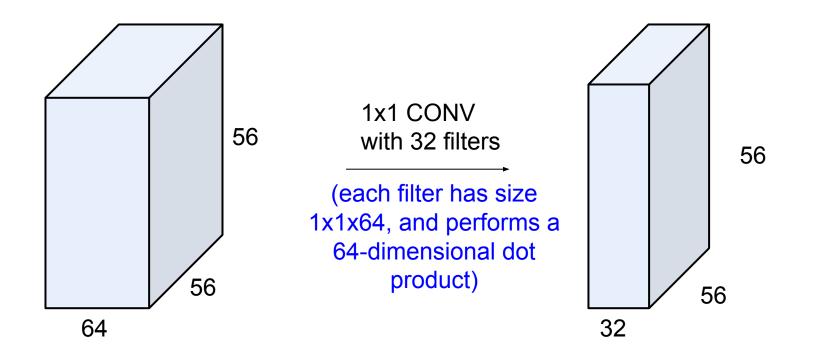

Number of parameters: F²CK and K biases

K = (powers of 2, e.g. 32, 64, 128, 512)

Example: CONV layer in PyTorch

Conv2d

CLASS torch.nn.Conv2d(in_channels, out_channels, kernel_size, stride=1, padding=0, dilation=1, groups=1, bias=True)

[SOURCE]

Applies a 2D convolution over an input signal composed of several input planes.

In the simplest case, the output value of the layer with input size $(N, C_{\rm in}, H, W)$ and output $(N, C_{\rm out}, H_{\rm out}, W_{\rm out})$ can be precisely described as:

$$\operatorname{out}(N_i, C_{\operatorname{out}_j}) = \operatorname{bias}(C_{\operatorname{out}_j}) + \sum_{k=0}^{C_{\operatorname{in}}-1} \operatorname{weight}(C_{\operatorname{out}_j}, k) \star \operatorname{input}(N_i, k)$$

where \star is the valid 2D cross-correlation operator, N is a batch size, C denotes a number of channels, H is a height of input planes in pixels, and W is width in pixels.

- stride controls the stride for the cross-correlation, a single number or a tuple.
- padding controls the amount of implicit zero-paddings on both sides for padding number of points for each dimension.
- dilation controls the spacing between the kernel points; also known as the à trous algorithm. It is harder to
 describe, but this link has a nice visualization of what dilation does.
- groups controls the connections between inputs and outputs. in_channels and out_channels must both be divisible by groups. For example,
 - At groups=1, all inputs are convolved to all outputs.
 - At groups=2, the operation becomes equivalent to having two conv layers side by side, each seeing half the input channels, and producing half the output channels, and both subsequently concatenated.
 - At groups= in_channels, each input channel is convolved with its

own set of filters, of size: $\begin{bmatrix} C_{out} \\ C_{in} \end{bmatrix}$.

The parameters kernel_size, stride, padding, dilation can either be:

- a single int in which case the same value is used for the height and width dimension
- a tuple of two ints in which case, the first int is used for the height dimension, and the second int for the width dimension

PyTorch is licensed under BSD 3-clause.

Conv layer needs 4 hyperparameters:

- Number of filters **K**
- The filter size F
- The stride S
- The zero padding **P**

Lecture 5 - 103

The brain/neuron view of CONV Layer

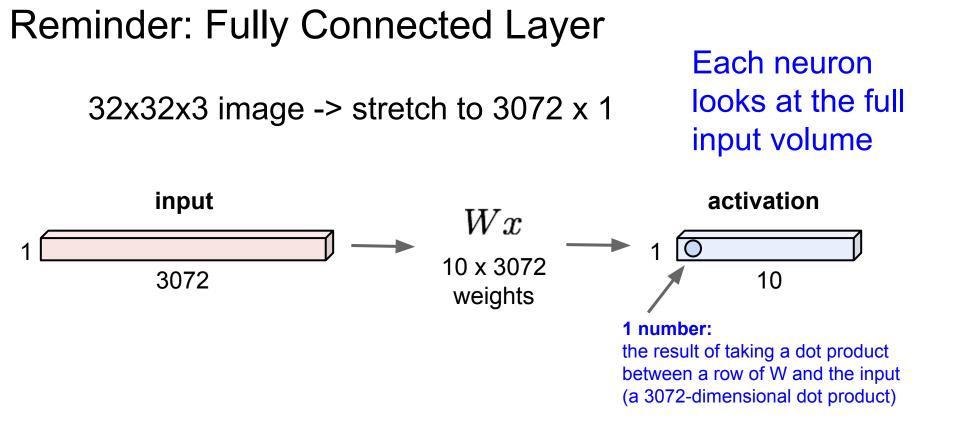

E.g. with 5 filters, CONV layer consists of neurons arranged in a 3D grid (28x28x5)

There will be 5 different neurons all looking at the same region in the input volume

V

Pooling layer: summary

Let's assume input is $W_1 \times H_1 \times C$ Conv layer needs 2 hyperparameters:

- The spatial extent F
- The stride **S**

This will produce an output of $W_2 \times H_2 \times C$ where:

Lecture 5 - 110

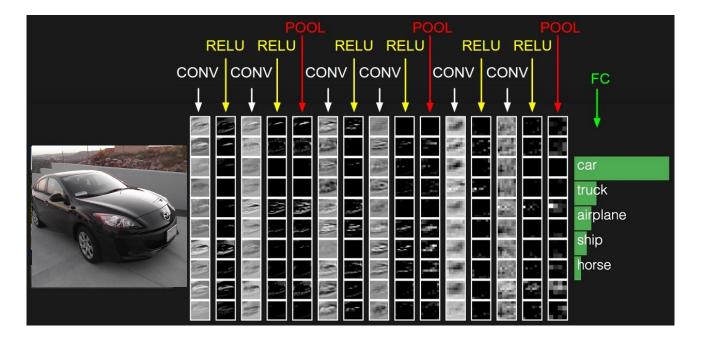

April 12, 2022

- $W_2 = (W_1 F)/S + 1$
- $H_2^{-} = (H_1 F)/S + 1$

Number of parameters: 0

Fully Connected Layer (FC layer)

- Contains neurons that connect to the entire input volume, as in ordinary Neural Networks

[ConvNetJS demo: training on CIFAR-10]

ConvNetJS CIFAR-10 demo

Description

This demo trains a Convolutional Neural Network on the <u>CIFAR-10 dataset</u> in your browser, with nothing but Javascript. The state of the art on this dataset is about 90% accuracy and human performance is at about 94% (not perfect as the dataset can be a bit ambiguous). I used <u>this python script</u> to parse the <u>original files</u> (python version) into batches of images that can be easily loaded into page DOM with img tags.

This dataset is more difficult and it takes longer to train a network. Data augmentation includes random flipping and random image shifts by up to 2px horizontally and verically.

By default, in this demo we're using Adadelta which is one of per-parameter adaptive step size methods, so we don't have to worry about changing learning rates or momentum over time. However, I still included the text fields for changing these if you'd like to play around with SGD+Momentum trainer.

Report questions/bugs/suggestions to @karpathy.

Lecture 5 - 112 April 12, 2022

Summary

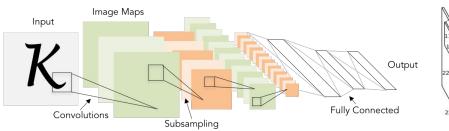

- ConvNets stack CONV,POOL,FC layers
- Trend towards smaller filters and deeper architectures
- Trend towards getting rid of POOL/FC layers (just CONV)
- Historically architectures looked like [(CONV-RELU)*N-POOL?]*M-(FC-RELU)*K,SOFTMAX where N is usually up to ~5, M is large, 0 <= K <= 2.

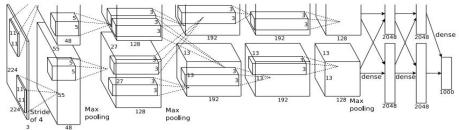

Lecture 5 - 113
